(54) Title: **WEB PAGE ACCESSING SYSTEM AND METHOD USING REAL NAMES**

(57) Abstract: Disclosed is a web page accessing system and method using real names. A real name database stores one or more real names with respect to one Internet address. When a client inputs an access word on a browser to access a specific web page, the real name server searches for the real name database and finds the corresponding Internet Protocol (IP) address and provides the same to the client. Therefore, the client accesses the web page corresponding to the IP address provided by the real name server. Since the user can access the desired web pages using the real name as well as the conventional English domain name, the user does not need to remember the domain names of the specific web pages in every case.
